

Portogruaro Interporto S.p.A.

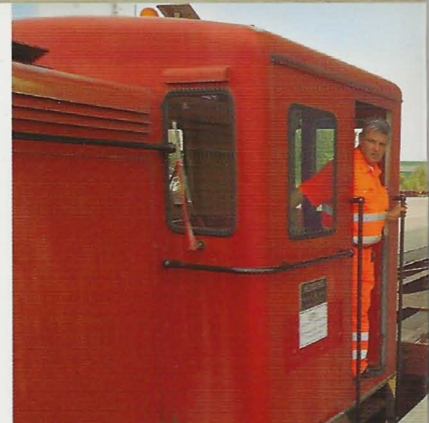

## A world of choice

A major force  
for a borderless  
economy.

A strategic hub in the region's economy, the Portogruaro Interporto S.p.A. involves the intersection of the railway line carrying the traffic of the Tarvisio and Pontebba passes, the A4 Venezia-Trieste and A28 Portogruaro-Pordenone motorways and the main road no. 53.

The systems linking road and rail, through an agreement with the Italian state railway board, and the coming into operation in the year 2000 of the direct line with Treviso, make the Centre the most important frame of reference in the area for handling freight and for national and international groupage services.

With seven railway tracks, each about 5,000 metres long, connected to the station of Portogruaro, the Centre allows transport of goods to and from the interport facility for a planned annual traffic of approximately five thousand wagons.

A vital centre of development for northeast Italy, the Portogruaro Interporto S.p.A. can rely on an efficient integrated logistics service for guaranteeing management, distribution and delivery of freight via special warehouses, the planning of flows and the preparation of consignments.

## Development as a constant factor

Advanced structure,  
reliable strength.

The undisputed value of the organisation of the Portogruaro Interporto S.p.A. and the inherent potential in its structure are combined with a particularly advanced computer system, for constant improvements in management efficiency and specific answers, in real time, to the most widely-varying demands of companies.

Warehouses with facilities, specialist staff, computers, radiofrequency terminals: the Interporto can boast leading-edge working methods and services in order to guarantee intelligent handling of goods, the freight transport system being one of the key structures in all economic organisations.
